# Method and sources

The register compares harvest quotas by region and hunting season. The numbers reflect the permitted limit for bear killings during one hunting season. Where it says 'limit not specified,' data is usually missing, or bears are no longer present in those regions due to their complete eradication. Occasionally, bears from other regions may cross borders, but this is not accounted for. Data is collected and verified manually from official regional government documents. If data is missing, the region is skipped, but this does not mean bears are not hunted there or quotas are not issued.

Author's summary table and update for the 2026/2027 season. Figures require verification with regional acts; where a primary document link is not provided, the entry should not be considered independently confirmed.

The register is maintained independently as part of the public and research work of Pavel Pashkov. Its goal is to make the basis for decisions on bear harvesting visible and verifiable.
